Sequential and combinational circuits

Switching system: a combinational circuit which transforms the input excitation to its corresponding output, the input and output are all function of time. The output is dependent only on the present input conditions.

combinational circuit

$$z_i(t) = f(x_i(t))$$

Sequential circuit: the system outputs are dependent not only on the present input conditions but also on the past history of the system. The past history is usually regarded **states** which obviously require memory devices to remember their states.

sequential circuit

$$z_i(t) = f(x_i(-\infty, t))$$

3

Synchronous and asynchronous systems

- **Synchronous** sequential systems in which the change of state takes place at discrete instants of time defined by a synchronizing input called the *clock*.
- **Asynchronous** sequential systems, the states can change at any time as a function of input changes, there is no external synchronization.

4

States

- With continuous inputs, the input time functions can be group into classes.
- All time functions have the same effect on the output at time t .
- Practically, the number of classes is finite.
- These classes are represented by the auxiliary variables s_i called states.
- States summarize the effect of past inputs.
- Make decision for present and future outputs.

5

Sequential Circuit Structure

6

States machine

- The state machine is illustrated using state diagram. A state diagram consists of circles which present the states; and lines connecting the circles that represent the transition of states.

- Mealy machine

$S = \text{state}$
 $x = \text{input}$
 $y = \text{output}$

- Moore machine

7

Mealy Machine

- A state is represented by a circle

- Transitions between states are indicated by directed lines connecting the circles

For the present state S_i , if the next input is x , the state will change to S_j and produce an output z

Mealy Machine

■ What will the circuit behave if the input sequence to the circuit is 011010?

■ Given the initial state is S_A

Time	0	1	2	3	4	5
Present State (PS)	S_A					
Input X	0	1	1	0	1	0
Output Z						
Next State (NS)

Next State (NS)						

Moore Machine

- A state and its output is represented by

- Transitions between states are indicated by directed lines connecting the circles

For the present state S_i , its output is z_i (independent of the next input).
If the next input is x , the state will change to S_j

- The input only affects the next state but not the output

Design Example

Free-running Counter

Design a free-running counter with counting sequence 2, 4, 5, 3, 7, 2, ...(and repeat) using *D* flip-flops

■ Analysis

- Free-running $\rightarrow$ 0 inputs
- There are five numbers: 2, 4, 5, 3, 7
- Therefore, there are 5 states
- 3 flip-flops are required
- The largest number is $7 = (111)_2$
- Therefore, the number of outputs is 3
- The counter will count
 - $010 \rightarrow 100 \rightarrow 101 \rightarrow 011 \rightarrow 111 \rightarrow 010 \dots$

21

Free-running Counter

Moore Machine Structure

- Derive the state diagram and state table

22

Free-running Counter

- Assign the state as the output code
 - $S_A = 010, S_B = 100, S_C = 101, S_D = 011, S_E = 111$
- Rewrite the state table as follow

PS	NS	Output $Z_0 Z_1 Z_2$
S_A	S_B	0 1 0
S_B	S_C	1 0 0
S_C	S_D	1 0 1

Free-running Counter

Find the flip-flops input equation

- $D_A(Q_A, Q_B, Q_C) = \Sigma m(2, 3, 4) + \Sigma d(0, 1, 6)$

- $D_B(Q_A, Q_B, Q_C) = \Sigma m(3, 5, 7) + \Sigma d(0, 1, 6)$

- $D_C(Q_A, Q_B, Q_C) = \Sigma m(3, 4, 5) + \Sigma d(0, 1, 6)$

29

Free-running Counter

- $D_A(Q_A, Q_B, Q_C) = Q_A' + Q_C'$

- $D_B(Q_A, Q_B, Q_C) = Q_C$

- $D_C(Q_A, Q_B, Q_C) = Q_B' + Q_A'Q_C$

30

7.2 Sequential Circuit Analysis

- To analysis a sequential circuit
 - To verify the circuit
 - To determine its state model
 - To obtain its state diagram
 - To obtain its state table
 - To obtain its state equation

31

Analysis Example

- **First**, determine its state model
 - Mealy, or Moore?

32

Analysis Example

■ **Next**, determine the flip-flop input functions

■ $J_A = Q_B, K_A = X'Q_B$

■ $J_B = X', K_B = X \oplus Q_A$

33

Analysis Example

■ **Start analysis**

■ Number of flip-flops: 2

■ Since there are two flip-flops, this circuit has at most 4 states

■ Number of inputs: 1

■ Number of outputs: 1

■ $Z = Q_A \oplus Q_B$

34

Write the Analysis Table

- Fill in present state first

Present State (PS)
State ($Q_A Q_B$)
$S_A (00)$
$S_B (01)$
$S_C (10)$
$S_D (11)$

- Then fill in inputs

Present State (PS)	Input
State ($Q_A Q_B$)	X
$S_A (00)$	0
	1
$S_B (01)$	0
	1
$S_C (10)$	0
	1
$S_D (11)$	0
	1

35

Write the Analysis Table

- Then fill in inputs to flip-flops

■ $J_A = Q_B$, $K_A = X'Q_B$, $J_B = X'$, $K_B = X \oplus Q_A$

Present State (PS)	Input	Flip-Flops' Excitations			
State ($Q_A Q_B$)	X	J_A	K_A	J_B	K_B

	1	0	0	0	0
$S_D (11)$	0	1	1	1	1
	1	1	0	0	0

Write the Analysis Table

- Then obtain the next state

Present State (PS)	Input	Flip-Flops' Excitations				Next State (NS)
State ($Q_A Q_B$)	X	J_A	K_A	J_B	K_B	$Q_A Q_B$
